

### **Capstone Presentation Personal Writeup**

In this project I have add assignment functionality in the functions.sh which adds assignment if the assignment ID doesn't exist. If the assignment ID doesn't exist it will ask the user to enter the date its due, the time the assignment is due, the name of the assignment, the difficulty level, and the status. If the user is done with the entry it will exit, otherwise it will ask the user to renter the assignment ID. if the assignment ID does exist it will not create another record to prevent it from duplication of the same record. I have also created a record file for assignment, and I also have setup the menu for main.sh file. I also setup the function showing incomplete assignments and the number of incomplete assignments that are due. If there are no incomplete assignments, it will output there are no incomplete assignments.
